

Steps to Add a New Wiki Page

- i. Choose a name for your new page. See [WikiPageNames](#) for naming conventions.
- ii. Edit an existing page (or any other resources that support [WikiFormatting](#) and add a [link](#) to your new page. Save your changes.
- iii. Follow the link you created to take you to the new page. Trac will display a "describe PageName here" message.
- iv. Click the "Edit this page" button to edit and add content to your new page. Save your changes.
- v. All done. Your new page is published.

You can skip the second step by entering the [CamelCase](#) name of the page in the quick-search field at the top of the page. But note that the page will effectively be "orphaned" unless you link to it from somewhere else.

Rename a page

While picking up good [WikiPageNames](#) is important, you can always change your mind and rename the page later.

You'll need to ask for the WIKI_RENAME permission in order to be allowed to do this. When renaming a page, you'll be offered the possibility to create a redirection page, so that links pointing to the old location will not be left dangling.
